This study aimed at knowing the early marriage relation with Female psychological adjustment , and exactly the study have tried to answer the following questions:

Is there any significant statistical differences in female psychological adjustment between those who were married early and those who were married not early

Does early marriage have a negative impact on female psychological adjustment ?

Is there any significant statistical differences in female psychological adjustment between early married females and females that have not marry at all?

Is there any significant statistical differences in psychological adjustment between early married females who refer to religion in solving their problems , and those married females who do not refer to religion in solving their problems?

To answer the questions of this study's the researcher have used atool to measure the degree of self psychological coordination in adults over five distances :

- \* physical distance .
- \* psychological distance.
- \* family distance.
- \* Social distance.
- \* Fitting in distance.

This was adopted With some editing in some parts to suit the society of the study which was prepared by Al-Deeb (1999).

The study society consisted of all female students of Alquds open University ,in hebron area . and the study sample consisted of " 178" female student registered in Alqudsopen University in Hebron area

The percentage of the study sample was 16% of the total number of the study society which counted ( 1100 ) female students in the academic year 2000/2001

To answer the study questions a statistical examination One Analysis of Variance, t-test, Pearson Correlation , Alpha way and each assumption was chosen at the level of significance ( $\alpha=0.05$ ).

The study have shown the coming results:

- 1- Statistical significant differences were found at the level of significance ( $\alpha =0.05$ ) to the benefit of married females at the family distance.
- 2- statistical significant differences were found at the level of significance ( $\alpha =0.05$ ) to the benefit of early married females at the psychological distance and Total Degree .
- 3- statistical significant differences were not found at the level of significance ( $\alpha =0.05$ ) between psychological adjustment with its different levels and between living place .
- 4- statistical significant differences were not found at the level of significance ( $\alpha =0.05$ ) between psychological adjustment with its different levels and between the academic year.
- 5- statistical significant differences were found at the level of significance ( $\alpha =0.05$ ) at all levels of psychological adjustment to the benefit of the higher average .
- 6- statistical significant differences were found at the level of significance ( $\alpha =0.05$ ) to the benefit of the early married females who use the religion as a reverse to solve problems at all levels of psychological adjustment .

At the end of this study, The researcher recommended some recommendations that are related to the results of this study.
