## **Dedication**

To my Father, who tirelessly struggled against the hurdles of this world, just to see his son attain the greatest gift of all.

To my world to my mother to whom my life and success.

To my Wife, who kindly, remained by my side, with unending love, being patient, motivation and supporting.

To my brothers for supporting me.

To my kids ( Naim & Hanan ) for their encouraging smiles.

To my friends

To my colleagues

To all neonates with respiratory distress syndrome with my pray for them to have a good health.

And, to everyone who contributed to make this study a reality,  
thank you.

Hani N. I. Awad

## **Declaration**

I certify that this thesis submitted for the degree of Master is the result of my own research, except where otherwise acknowledged, and that this thesis (or any of its parts) has not been submitted for a higher degree to any other university or institution.

**Signed:** .....

**Hani N. I. Awad**

**Date: 11/1 /2020**

## **Acknowledgment**

First, and foremost, I will like to give thanks to God for the love and support of family and friends that have been given me through this journey. To my supervisor, Dr. Mohammed Al jerjawy, I thank you for your patience, guidance, correction, and support. This would not have been completed without you.

I would also like to extend my warm appreciation and sincere gratitude to all people who were involved in completing the research work.

My greatest debt is to my sincere parents. Their hard work, motivation, and encouragement was my real inspiration since childhood. My very special respects are offered to my beloved wife Aya whose patience and loving-kindness enabled me to complete this study.

The list of acknowledgments will be incomplete without mentioning gratitude towards my brothers. Their support and understanding always boosted my morale and made my way easy to follow my dreams.

**My sincere thanks extend to all nurses who participated in this study.**

## **Abstract**

Preterm infants are at risk for respiratory distress syndrome, neonatal respiratory distress syndrome (RDS) is a major cause of illness and death for premature infants. RDS or Hyaline Membrane Disease (HMD) is defined as a syndrome caused by developmental insufficiency of surfactant production and structural immaturity in the lungs at birth results in decreased compliance of the lung. Lung maturation is usually inadequate to sustain extra uterine life. The aim of this study was to assess the nursing knowledge and practice provided for preterm neonates with respiratory distress syndrome in the Neonatal Intensive Care Units (NICUs) in Gaza Governorates. Study design: It was a quantitative descriptive analytic cross-sectional study. Subjects and Methods: The study was carried out in the NICUs at four hospitals "Al Shifa complex - Al Nassr pediatric hospital - Naser hospital - European Gaza hospital" the sample consisted of all nurses employed in NICUs at the previously mentioned hospitals. The total number of nurses was 110 (census sample), the researcher used a self-administered questionnaire that used to assess the nurses' knowledge and practice regarding nursing care provided to preterm neonates with RDS to collect data from study participants. Results: the current study revealed that the mean percentages of knowledge was (76.96%). And the level of practicing care for neonates with RDS was (84%). Conclusion: the current study concluded that there were no statistically significant differences between age, gender, job title and experience of the nurses and their levels of knowledge of care for neonates with RDS. Regarding the hospital, there were statistically no significant differences between hospitals and nurses' level of knowledge, but there were statistically significant differences with level of practice regarding care for neonates with RDS. Recommendations: It was recommended that educational and training programs is needed for improving nurses' knowledge and practice about their care for neonates with RDS in the NICUs.

# **Chapter One**

## **Introduction**

### **1.1 Background**

Preterm birth is the birth occurring before 37 completed weeks of gestation and those neonates susceptible to many health problems including Respiratory Distress Syndrome (RDS) (WHO, 2017).

RDS also known as hyaline membrane disease (HMD), is a life threatening lung disorder that result from under developed and small alveoli and insufficient levels of pulmonary surfactant (Schraufnagel, 2010). RDS is the single most important cause of morbidity in preterm neonates, especially before 34 weeks gestation and is the most common cause of mortality (Dargaville&Tingay, 2012). Acute RDS is a sudden, progressive form of respiratory failure characterized by severe dyspnea, hypoxemia and diffuse bilateral infiltrates. It is a life-threatening lung disorder that commonly affects premature infants (Dorothy et al., 2010).

Factors that increase the risk for neonatal RDS including prematurity, diabetic mother, multiple pregnancy, rapid labor and cesarean delivery that reduce blood flow to the baby, the earlier baby is born, the less developed lungs and the higher chance of neonatal RDS (Joyce et al., 2008).The symptoms of RDS usually appear within minutes after births which includes cyanosis, apnea, decreased urine output, nasal flaring, rapid breathing, shortness of breath and grunting sounds while breathing, unusual breathing movement drawing back of the chest muscles with breathing. Therefore, high-risk and premature infants require prompt attention by a neonatal resuscitation team (Behrman et al., 2007).
