AJC-0000

Teucrium polium leaf is one of the folkloric medicinal plants used traditionally to treat many diseases in the Palestinian community. It has antibacterial antioxidant and anti-inflammatory consequences. Present study aims the evaluating the *in vitro* inhibitory effect of *Teucrium polium* leaf extracts on tumor necrosis factor- α (TNF- α) using polymorphonuclear cells (PMNCs), in addition to determine its antioxidant and total phenolic and flavonoids contents. Polymorphonuclear cells were withdrawn from whole blood according to Histopaque (Ficol-1077) method. Blood cells were cultured in an enriched Roswell Park Memorial Institute (RPMI) medium. The levels of tumor necrosis factor (TNF- α) were determined 24 h using LPS stimulation. Total phenolic contents, flavonoids contents and antioxidant activity were measured using spectrophotometric method. The TNF- α concentrations were compared using paired-samples t test. The leaf extracts of *Teucrium polium* revealed significant reduction in terms of TNF- α levels. The extract contained high phenolic and flavonoids contents and its antioxidant activities were strong. The reduced values in the TNF- α levels as affected by *Teucrium polium* leaf extracts indicate its effect in anti-inflammation. The plant is rich with polyphenolic compounds and flavonoids and has strong antioxidant activity. The observed anti-inflammatory effect of the extracts under study may be discussed as the influence of the significant presence of the phenolic compounds and flavonoids.

Keywords: *Teucrium polium*, Plant extracts, TNF- α , Anti-inflammatory effect.

INTRODUCTION

Folkloric medicine had been used for a long time in all around the world. Palestine is among the areas that are famous in using the herbs to treat many diseases. *Teucrium polium* (TP) is a well-known native Palestinian plant. It belongs to *Lamiaceae* family and has many species that is thought to recur many diseases such as diabetes and some liver disorders. It is used to alleviate pain related with coughing, miscarriage and pregnancy [1-3]. *T. polium* was among many medicinal plants that have been used to treat rheumatism, inflammations, indigestion and common cold.

Many different compounds were isolated from the medicinal plant under investigation including flavonoids and terpenoids. Such compounds are well known in their pharma-

cological effects such as hypoglycemic, anti-inflammatory, hepatoprotective, antifungal, antibacterial and hypolipidemic [4].

Different components of *Teucrium polium* have indicated anticancer activities against many types of tumors. Such effect was shown in some studies on different types of cancer cells as MDA-MB-231 and MCF-7 breast carcinoma, epidermoid carcinoma (A431), Saos-2 osteoblastoma, K562 chronic myelogenous leukemia, SW480 colon carcinoma, BT20 human breast ductal carcinoma, K562 chronic myelogenous leukemia, A549 human lung adenocarcinoma cell lines and PC12 mouse pheochromocytoma and REYF-1 glioblastoma multiforme [5-8].

Previous studies documented the effect of the studied plant extract on the male reproductive system. The aqueous extract of *T. polium* has increased the testosterone levels, testicular weight, spermatogonia, spermatozoa and Leydig cells in the

51 treated groups [8]. In the other hand, chronic treatment with
52 the *T. polium* ethanolic extract led to a clear reduction in the
53 mice testes' weight as well as increase in sperm abnormalities.
54 Also, glucose levels were decreased compared to the control
55 treatment [9]. The essential oil of the *T. polium* has shown an
56 antibacterial activity against resistant microorganisms as
57 *Escherichia coli*, *Staphylococcus aureus*, *Bacillus cereus* and
58 *Pseudomonas aeruginosa* [10,11].

59 Although high number of herbs and parts of trees used
60 worldwide in folkloric therapy, few of them were tested pharm-
61 acologically and phytochemically for pharmaceutical applica-
62 tions. Plenty of the active ingredients reported out of medicinal
63 plants may carry out antimicrobial, anti-inflammatory and free
64 radicals scavenging action. Biologically active ingredients may
65 include phenolic compounds, anthocyanins, caratenoids and
66 thiols [12,13].

67 Inflammation response is part of the innate immunity used
68 by human body against invading pathogens. Therefore helps
69 in healing injured tissues. Pro-inflammatory cytokines (inter-
70 lukin-6 (IL-6) and tumor necrosis factor (TNF- α)) may create
71 injury to normal tissues at the time of inflammation process
72 within the human tissues. Excessive production of these cyto-
73 kines may emerge into chronic inflammatory diseases as asthma,
74 rheumatoid arthritis and atherosclerosis. Drugs having anti-
75 inflammatory activity decrease such proinflammatory cytokines
76 production and therefore enhance the symptoms of inflam-
77 mation [14-15].

78 Tumor necrosis α and interleukin-6 are produced by the
79 monocytes, T-cells, B-cells, endothelial cells and other cells as
80 pro-inflammatory mediators. The release of these pro-inflam-
81 matory cytokines could be stimulated by lipopolysaccharide
82 (LPS) of Gram-negative bacteria as an endotoxin and part of
83 an outer cell membrane component of these bacteria. Therefore,
84 LPS triggers inflammation and may cause septic shock [16-18].
85 The anti-inflammatory effect of *T. polium* has not been exten-
86 sively investigated. In present research, we have focused on
87 anti-inflammatory, antioxidant activities in addition to the deter-
88 mination of the contents of total phenolic compounds and total
89 flavonoids of *T. polium* leaves extracts.

EXPERIMENTAL

90 **Plant material and extraction:** *Teucrium polium* plant
91 was collected in April 2020. The plants were air-dried in shade
92 for 2 weeks, then were grinded. Grinded material (50 g) was
93 mixed with 500 mL of 96% ethanol and left on the shaker for
94 5 days. The mixture was filtered through Whatman filter paper.
95 Using rotary evaporator at 50 °C, the filtrate was dried leaving
96 the extract.

97 **Isolation of whole blood polymorphonuclear cells:** Whole
98 blood from an adults healthy person was transfused, from which,
99 a 5 mL was freshly collected in an EDTA tube and then diluted
100 with equal volume of phosphate buffered saline (PBS) under
101 completely sterile condition. The diluted blood was gently
102 mixed. Consequently, 3 mL Histopaque (Ficol-1077) were
103 pipetted into a sterile, 15 mL conical tube. The blood and PBS
104 mixture were added gently to the Histopaque and the tube was
105 spun for 20 min at 400 g. The mixture was separated into four

distinct layers: red blood cells, Ficol layer, polymorphonuclear 106
cells (PMNCs) and PBS and the plasma from lower to upper 107
layer. 108

The polymorphonuclear cells were aspirated and washed 109
with 10 mL of PBS in 12 mL conical tubes for three times at 110
100 g for 10 min each time. The supernatant was discarded 111
and the PMN cells were collected. 112

Cell culture: The poly morpho nuclear cells were isolated 113
and treated to investigate the anti-inflammatory effect of the 114
extract according to Qabaha *et al.* [12]. 115

Cytotoxicity test: Toxicity of the *T. polium* extract was 116
evaluated using the trypan blue exclusion test according to 117
Avelar-Freitas *et al.* [19]. 118

Determination of total phenolic content: A reaction 119
mixture of 0.2 mL of extract (5 mg/mL), 1 mL of diluted Folin- 120
Ciocalteu's reagent and 0.8 mL NaHCO₃ (7.5%) was incubated 121
at 45 °C for 45 min. Gallic acid (GA) was used as a standard 122
and total phenolic contents were expressed in terms of gallic 123
acid equivalents (mg of GA/g of extract). 124

Determination of total flavonoids content: To 1 mL of 125
extract, 4 mL of distilled water, 0.3 mL of 10% AlCl₃ and 0.3 126
mL of 5% NaNO₂ was added. After 6 min, 2 mL of 1 N NaOH 127
and 2.5 mL of distilled water were added to the mixture, then 128
was measured for absorbance at 510 nm. Results were expres- 129
sed in mg catechin/g. Calibration curve of different concentra- 130
tions of catechin was prepared and the absorption was measured 131
at 510 nm. 132

DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging method: The total antioxidant activity of the extract was 133
assayed using DPPH as follows: Aliquots of various concen- 134
trations of the extract (0 to 2000 μ g/mL) were added to 1 mL of 135
0.004% methanol solution of DPPH. Samples were incubated 136
for 30 min at room temperature, then absorbance was measured 137
at 517 nm. All determinations were done in triplicate. Inhibition 138
of free radical scavenging activity was calculated as follows: 139
140

$$\text{Inhibition (\%)} = \frac{\text{Abs}_1 - \text{Abs}_2}{\text{Abs}_1} \times 100 \quad 141$$

where, Abs₁ is the absorbance of the negative control which is 142
a solution of 100 μ L methanol 95% and Abs₂ is the absorbance 143
of the positive control. 144

The concentration of the extract that give 50% inhibition 145
(IC₅₀) was determined from a graph plotting percentage inhi- 146
bition against extract concentration. Trolox was used as a stan- 147
dard, in the concentration range of 0-100 μ g to construct a 148
calibration curve and DPPH radical-scavenging activities were 149
expressed as μ g Trolox equivalents per mL of plant extract. 150

Ferric reducing antioxidant power (FRAP): This assay 151
is a measure of the ability of the antioxidants to reduce ferric 152
ions to the ferrous ions. To prepare a fresh FRAP reagent, 10 mM 153
TPTZ (1 mL) and 20 mM ferric chloride (1 mL) in 0.25 M 154
acetate buffer (10 mL, pH 3.6) were mixed together. The plant 155
extract (50 μ L) was added to 3 mL FRAP reagent obtaining a 156
final concentration of 100 μ g/mL. The absorbance of the samples 157
(in triplicate) was measured after 8 min of incubation (room 158
temperature) at 593 nm. This antioxidant capacity of the plant 159
extract was calculated as μ g Trolox equivalents per g of extract. 160

161 **Statistical analysis:** All statistical analyses were performed
 162 using SAS (SA Institute Inc., Cary, USA, Release 8.02, 2001).
 163 Means comparisons between different concentrations of TNF- α
 164 were tested using the GLM procedure. The Bonferoni test was
 165 employed with multiple t-test to maintain an experiment-wise
 166 of 5%. Results were shown as mean \pm standard deviation (SD).

RESULTS AND DISCUSSION

167 **Cytotoxicity of the extracts:** Lipopolysaccharide (LPS)
 168 at concentration of 1 $\mu\text{g/mL}$ and *Teurium polium* extracts
 169 concentration of 500 $\mu\text{g/mL}$ have no significant effect on the
 170 PMN cells viability as shown in Table-1.

TABLE-1
EFFECTS OF *T. polium* EXTRACTS AND
LPS ON VIABILITY OF PMNCs

Treatment	Viability (%)
PMNCs only	96.3
PMNCs with LPS	94.5
PMNCs with LPS and 500 $\mu\text{g/mL}$ of <i>T. polium</i> extract	91.0

171 **Anti-inflammatory activity of plant extract:** The meas-
 172 urement of the level of TNF- α by the mono nucleated white
 173 blood cells corresponding to the effect of LPS at different concen-
 174 trations indicate the anti-inflammatory effect of the plant extract.
 175 Concentrations of the cytokines were evaluated using Enzyme
 176 Linked Immune Sorbent Assay (ELISA) method.

177 The level of the TNF- α produced by LPS stimulated PMNCs
 178 after 24 h has increased significantly. However, after treatment
 179 with 250, 500 and 1000 $\mu\text{g/mL}$ extract of *T. polium* in the cell
 180 culture, the TNF- α levels were reduced significantly indicating
 181 the strong anti-inflammatory effect of this extract. Results are
 182 illustrated in Table-2.

TABLE-2
T. polium EXTRACT EFFECT ON PMNCs RELEASE OF TNF- α

Treatment	TNF- α value (pg/mL)	
	Average	STD
Cells only	111	1.4
Cells with LPS	591	1.4
Cells with LPS and 250 μg extract	40.5	1.7
Cells with LPS and 500 μg extract	10.5	0.8

183 **Free radical scavenging activity of *T. polium* extract:**
 184 To explore the antioxidant potential of the *T. polium*, the extract
 185 was analyzed for their capacity to scavenge oxidative radicals.
 186 The DPPH radical scavenging potential and FRAP of *T. polium*
 187 extract were assessed and compared to the positive control
 188 (Trolox) and expressed as TEAC (μg Trolox/g of plant extract).
 189 The TEAC for the extract was found to be 73.13 $\mu\text{g/g}$ and IC₅₀
 190 was 15.1 $\mu\text{g/g}$ for plant extract by using DPPH (Table-3). Simi-
 191 larly, with respect to FRAP radical scavenging activity, the
 192 plant extract had 6.41 TEAC (μg Trolox/g of plant extract).

193 **Total phenolics and flavonoids content:** The ethanolic
 194 extract yield, the total phenolic and flavonoids content of the
 195 plant extract is presented in Table-3. In this study, *T. polium*
 196 extract show higher concentration of phenol concentration with

TABLE-3
TOTAL FLAVONOIDS CONTENT (mg CA/g PLANT
EXTRACT), TOTAL PHENOLIC COMPOUNDS (mg GAE/g
PLANT EXTRACT), DPPH SCAVENGING ACTIVITY
(μg TEAC/g), FRAP ACTIVITY (μg TEAC/g) AND % YIELD
OF *T. polium* ETHANOLIC EXTRACT

Yield* (%)	Total flavonoids	Total phenolic content	DPPH**	FRAP**
8.3	67.2 \pm 1.5	155.2 \pm 3.4	73.1 \pm 5.2	6.41 \pm 0.71

*Percentage extraction product (%) is represented as w/w g of dried extract. **DPPH radical scavenging activity and FRAP activity of extract is expressed as μg Trolox equivalent/g of plant extract.

155.2 mg GAE/g extract and high flavonoids content (67.2 mg CA/g).

197
198
199 Traditionally, *T. polium* medicinal plant has strong reputa-
200 tion for treating many diseases [1,2]. This work agrees with
201 previous studies in which phytochemical analysis of *T. polium*
202 showed the presence of alkaloids, flavonoids, terpenoids, tannins,
203 such compounds have a vital medicinal role against various
204 diseases [1-4]. This study demonstrated that *T. polium* is rich
205 in phenolic compounds, which are considered very important
206 components for their antioxidant activity, antibacterial, anti-
207 cancer, antiviral and anti-inflammatory activities [20]. Anti-
208 oxidants are molecules that suppress oxidation reactions by
209 quenching free radicals and hence, protects the cell or delay
210 its damage [20,21]. Natural antioxidant such as phenolic comp-
211 ounds (cinnamic acids, benzoic acids, flavonoids, coumarins,
212 lignans and lignins), ascorbic acid and carotenoids are second-
213 ary metabolites produced in significant amounts by medicinal
214 plants [21-23].

215 Many types of antioxidant tests are frequently used to
216 evaluate antioxidant activity of medicinal plant extracts. Most
217 of these methods depend on either measuring the potential of
218 plant to reduce oxidant such as FRAP assay or to scavenge
219 free radicals such as DPPH. The % of inhibition of DPPH at
220 different concentrations of crude extract was found to be a
221 dose dependent. The DPPH assay showed that ethanol extract
222 of *T. polium* has an antioxidant activity with IC₅₀ = 15.1. For
223 the FRAP assay, we found that ferric reducing ability of *T.*
224 *polium* extract is high (6.41 μg TEAC/g). These results proved
225 that *T. polium* extract has high antioxidant properties due to
226 the high total phenols and flavonoids. Such phenolic
227 compounds were reported by many studies to be a strong
228 antioxidants and radical scavenging agents [20-23].

229 Until now, there is no anti-inflammatory activity of *T.*
230 *polium* plant from Palestine and this fact motivated us to give
231 more insight into this activity. Ethanol was used in this work
232 to extract phytochemicals from this plant as it combines polar
233 and medium polarity solvent. Present results showed that the
234 *T. polium* ethanolic extract has strong anti-inflammatory effect.
235 This work agrees with previous study of Rahmouni *et al.* [24]
236 and Amraei *et al.* [25]. Our work was unique in its investigation
237 by using ethanolic extract exposed to LPS stimulated poly
238 morphonuclear cells (PMNCs). The concentrations of the
239 extract were gradually increased to investigate both its cyto-
240 toxicity as well as its anti-inflammatory effect. The ethanolic
241 extract of *T. polium* did not show any significant cytotoxicity.

242 Moreover, an increase in the extract concentration showed a
 243 significant decrease in TNF- α concentration indicating its
 244 strong anti-inflammatory effect. However, it appears that anti-
 245 inflammatory effect of the extract may related to the presence
 246 of flavonoids and phenolics in the plant [24,25].

247 Conclusion

248 In the present study, *Teucrium polium* leaves were screened
 249 for their potential antioxidant and anti-inflammatory activities.
 250 Based on the results, it could be concluded that *T. polium*
 251 exhibited different bioactivities, which supports their potential
 252 use as therapeutic medicinal plant having strong antioxidant
 253 and anti-inflammatory effects.

CONFLICT OF INTEREST

254 The authors declare that there is no conflict of interests
 255 regarding the publication of this article.
