

Declaration:

I certify that this thesis submitted for the degree of Master is the result of my own research, except where otherwise acknowledged, and that this thesis or any part of the same has not been submitted for a higher degree in any other university or institution.

Signed:

Mahmoud Nasr Amarna

Date:18.01.2010

Acknowledgment

My deep appreciation goes to my advisor Dr. Amer Marei for his constant help, priceless suggestions, for his kindness and generosity, and countless hours of attention, he devoted throughout the course of this work.

I am especially thankful and grateful to my Co - Supervisor Dr. Fuad Remawi for his efforts, guidance and help in reviewing and providing me with literature reviews and for his advices. Also I am thankful to Dr. Ibraheem Afana for his help and cooperation.

Thanks are also due to the work-team in the Water and Environment Research Lab at Al-Quds University, Mr. Ala' Amer, Miss Manal Al-Khateeb, Mrs. Yasmin Abdel'al,. And Mr. Hussam Eataer for extending facilities to this research.

Acknowledgments are due to, Palestinian National authority - Ministry of Agriculture - G.D. of extension and rural development for their help, and all those who gave me any advice related to this thesis.

Especial thanks for Bet Dagan and Asser Alsh mali farmers whom gave us samples from their crops olive oil and cooperate with us to apply this study. My appreciation for Mr. Maher Yassen – owner of Assera mill- for his cooperation.

I extend my thanks to the Foundation of the USDA over their financial support to cover part of the expenses of this study.

Abstract

The aim of this study is to investigate the quality of olive oil in North West Bank which is a representative of Palestinian olive oil. 40 samples were analyzed for iodine number, peroxide value, refractive index and free acidity using AOAC official method of analysis for fats and oils. Nitric acid test was also performed to indicate the olive oil purity (mixing with other oils). Steradienes content of the samples, which is a parameter used to test adulteration of olive oil and to test the presence of refined vegetable oils in virgin olive oil, has also been determined using the standard method (ISO171588-2).

To determine the effect of storage conditions on the quality of olive oil; two groups of olive oil samples were analyzed for steradienes content after 7 months of storage in dark conditions at room temperature and at 4°C. Other factors that may affect olive oil quality were also investigated. These factors are: use of fertilizers and pesticides, way of olive fruit collection and olive oil extraction method and some of metrological factors.

Results have shown that the average iodine number of the olive oil samples studied is 91.8 cg/g with refractive index of 1.4696 and free acid value of 1.22% and peroxide value of 19.1 meq/kg. Additionally, all samples have shown negative nitric acid test. These parameters are within virgin olive oil characteristics.

It was also found that the average of total Steradienes content of the studied olive oil samples is 0.45 mg/kg. These total Steradienes includes stigmastadiene (0.13 mg/kg), Cholestadiene (0.28 mg/kg), Stigmastatriene (0.01 mg/kg), and Campestadiene (0.03

mg/kg). According to the limit of stigmastadienes of virgin olive oil (0.15 mg/kg), the olive oil of North West Bank is virgin olive oil.

Samples were collected from two villages: Assera Al Shamalia (locates on North Eastern foothills) and Bet Dagan (Locates on Eastern foothills). The comparesion of olive oil quality parameters results for the two village's samples that differences in metrological factors and harvesting times between the two villages cause differences in olive oil quality and higher content of stigmastadiene in Bet Dagan than Assera olive oil.

The Classification of Palestinian olive oil (represented by Assera and Bet Dagan olive oil) according to acidity value and peroxide includes the following classes: Extra virgin olive oil (25%), Virgin olive oil (42.5%), Ordinary virgin olive oil (7.5%), Lampante olive oil (5%) and Olive oil (20%).

Table of Contents

No.	Subject	Page
Chapter One : Introduction		1
1.1	Background	1
1.2	Theoretical Framework	9
1.3	Problem Statement	11
1.4	Objectives	11
1.5	Hypothesis of the study	12
1.6	Study Overview	12
Chapter Two: Literature Reviews		13
Chapter Three : Methodology		26
3.1	Overview	26
3.2	Study area: Location & Climate	29
3.3	Instruments	31
3.3.1	HPLC	31
3.3.1.1	Reversed-Phase HPLC (RP HPLC or RPLC)	32
3.3.2	Refractometer	33
3.4	Sampling	34
3.5	Chemical analysis	35
3.6	Statistical analysis	37
3.7.1	Quality assurance	37

Chapter Four: Results and Discussion	38
4.1	General characteristics of data 38
4.2	Chemical analysis 40
4.2.1	Iodine value 41
4.2.2	Refractive index (nD20) 42
4.2.3	Acid Value 42
4.2.4	Peroxide value 43
4.2.5	Nitric acid test 44
4.2.6	Stigmastadiene content 44
4.2.7	Total sterenes content 46
4.4	Determination of relationships between olive oil quality parameters & environmental factors 47
4.4.1	Quality parameters correlations 47
4.4.1.1	Relationship between total sterenes and stigmastadiene 47
4.4.1.2	Relationship between sterenes content & acidity of olive oil in different Harvesting times 47
4.4.1.3	Relationship of sterenes & Iodine value in different Harvesting times 49
4.4.1.4	Relationship between sterenes content & Peroxide value in different Harvesting times 50
4.4.2	Metrological Data and Correlations with olive oil quality parameters 51
4.4.2.1	Metrological data & quality parameters 51

4.4.2.2	Correlation of olive oil sterenes content & temperature	55
4.4.2.3	Correlation of rainfall Precipitation & olive oil sterenes content	56
4.4.2.4	Correlation of Humidity & olive oil sterenes content	57
4.4.3	Storage test	59
4.4.4	Comparison of olive oil quality indexes between Palestinian olive oil and other countries olive oil	61
Chapter Five: Conclusions and Recommendations		63
5.1	Conclusions	63
5.2	Recommendations	65
