Abstract

The study was carried out between May 2016 and October 2018. It consisted of farmers and livestock owners in Masafir Bani Naim (Rural Area). The main objective of this study was to identify the assessment of assistance in the water sector on the Livelihoods of farmers and livestock owners in the Masafir Bani Naim area, depending on their opinion.

In this study, the researcher used the descriptive method. The sample of the study was chosen in simple random way from (150) farmers in Masafir Bani Naim who were selected randomly from the study community. To achieve the objective of the study, the researcher developed a questionnaire according to the theoretical framework. During a committee of specialized arbitrators, and its consistency was verified by examining the internal consistency of the instrument's paragraphs by calculating the coefficient of Cronbach alpha. The coefficient of stability was calculated according to the coefficient of alpha crombec (0.895).

The study find that the benefits of the aid provided ranged from high level to low level, as farmers in Masafir Bani Naim area differed as to the appropriateness of the assistance provided to them. "This discrepancy is due to differences in land area owned by each of them, or to fit the cultivated area or barns they own, and the farmers in Masafir Bani Naim feel that the assistance provided to the farmers in the region from abroad is almost good as they are effective in the economic development in the region, and to some extent sustainability, which the researcher recommends continuing to provide foreign aid to farmers, especially in the Bani Naim, to strengthen their steadfastness in their lands and the desire to continue planting them. It is also recommended to intensify assistance to farmers in the same area to improve their living conditions and develop their plant and animal production and expand their investment in this field.
